PRODUCT DESIGN EXERCISE

Design brief

Geotab Video mobile app

> **FIRST ROUND**
> Design **only the Home screen, in three UI variants** to choose between. The variants should differ in structure and hierarchy, not just color. Add one line per variant explaining its trade-off. After a direction is chosen, design the remaining screens in that style.

Problem

A fleet safety manager opens the app on a phone, one-handed, between meetings, to answer one question: **is my fleet safe right now, and who should I worry about?** Hundreds of events arrive each day and most are not worth watching. Video is expensive to load, and false positives make managers distrust automated flags. The goal is to understand risk and find the right video in **under 30 seconds**.

What to design

After choosing a Home direction, create high-fidelity mobile screens at 390 px wide with realistic sample data. This is an operational tool for fleet managers, not a consumer app. Make it clickable if possible.

AREA	SCREENS	MUST SHOW
Home	1. Home	Is my fleet okay? Who is risky? Do I need to act?
Cameras	2. Vehicle list 3. Vehicle detail	List filterable by vehicle number. Detail has camera status, live video, vehicle info, and a map.
Events	4. Event feed 5. Event playback	Filter by driver and behavior type. The feed helps the user decide which three videos matter. Playback shows the clip, why it was flagged, and confidence.
Drivers	6. Driver list 7. Driver detail	List with photo and safety score. Detail has score, trend over time, and known behaviors. Improving, stagnant, or dangerous must be obvious.

DESIGN DIRECTION

Prioritize

01 **Signal over volume.** Default views are curated. The full list is one step away.

02 **Speed.** Who is risky, what happened, and do I care should each be answerable in under 20 seconds.

03 **Built for fleet managers.** Dense, scannable, status first. No social-feed patterns.

04 **Judgment made visible.** Show what you hid (low-value events), collapsed (repeat events per driver), and deferred (live video, long history, map).

Constraints

- One-handed use: primary actions in the lower half of the screen, with bottom navigation.
- Video is opt-in: show thumbnails or status first; load video only on tap, and plan for weak connectivity.
- Show why an event was flagged and how confident the system is, so managers can trust or dismiss it quickly.
- Link screens by entity (event to driver to vehicle) so the user can jump sideways without returning Home.

How this will be judged

- Prioritization: are the right things shown first?
- Speed: can someone answer the three questions in under 20 seconds?
- Product thinking: does it feel made for fleet managers?
- Judgment: what was hidden, collapsed, and deferred, and why? UI polish is not the focus.

Bonus

Include a **60-second flow**: open the app, identify the risk, open the event, then make a decision - confirm and coach, or dismiss as a false positive.
