Geotab Video: Mobile Redesign PRD

A fleet safety manager opens the app on a phone, between meetings, to answer one question: is my fleet safe right now, and who should I worry about? The goal is to answer it, and find the right video, in under 30 seconds.

Design challenges

Problem	What happens today
Managers cannot tell which events matter	Hundreds of events arrive each day and most are not worth watching.
Managers cannot check evidence quickly	Video is costly to load on a small screen and a weak connection.
Managers cannot tell if a flag is real	False positives exist, and managers are skeptical of AI detection.

Success metrics

Metric	Definition	Target
Time to understand risk	Seconds from opening the app to naming who is risky, what happened and whether to act	Under 20 s
Time to right video	Seconds from opening the app to the first relevant clip playing	Under 30 s
Review precision	Share of reviewed events confirmed as worth action	Baseline first

The two time targets come from the brief. Review precision is proposed and needs a baseline.

Assumptions and open questions

- Events carry a short recorded clip and link to their driver and vehicle.
- Events may or may not have a severity or confidence score today.
- "Action" may mean review and dismiss only, or also coaching and messaging.
